

Speech for Postkvantnost d.o.o.

Zagreb Friday 24 October 2008

Welcome everybody,

It's a great honour and privilege to be here in Zagreb today and I have been looking forward to this moment. We are gathered here to announce the launch of a new company called 'Postkvantnost d.o.o'.

It is also the moment of the release of the Croatian translation of my book titled 'Buđenje duša distorzija'.

The original version of my book is titled 'Souls of Distortion Awakening' and it was released and published on January 15th 2005 on the Internet as a free e-book. The book became rather popular on the Internet in a surprisingly short time. About a year ago I was contacted and told that my book had been translated into Croatian. I was both surprised and grateful and we decided to release the Croatian translation on my website. Plans for a printed edition were made in spring of this year and it's my privilege to be able to present this book to you in hard copy form in Zagreb today.

Before I will delve into the backgrounds of my book, let me first introduce myself. I'm 45 years of age and have a technical education and background. I studied both at the Technical University of Eindhoven and the Technical Collage in Venlo in the Netherlands. I hold a bachelor's degree in both electrical and software engineering and I'm currently employed as a software engineer.

Although I've always been interested in the paranormal world, my scientific oriented education withheld me from accepting a spiritual domain beyond the physical. I kept a strong scepticism towards all supernatural phenomena. My world changed dramatically after consulting a psychic healer for about 18 months on a regular basis. Spending hours in the waiting room, talking to dozens of people and having personal experiences that I could not explain from my analytical left-brain oriented world-view, I finally had to accept the reality of a spiritual realm beyond the physical.

As a result I started to educate myself in spiritually and I spent years of reading about paranormal phenomena, near death experiences, reincarnation, Buddhism and New Age literature in general. At the end of the nineties I started to realize that a lot of scientists were finally bridging the gap between science and spirituality and from that moment on these scientists and scholars became the focus of my spiritual quest and personal scientific interest.

My endeavours finally culminated into connecting all the dots after years of study in my book titled 'Souls of Distortion Awakening'. The book is meant to be a wakeup call, a reminder of who we really are and where we came from. This message is very important especially now humanity is heading towards a crossroads in history. Prophecies are that we are reaching a crescendo in our spiritual evolution around 2012. Current world affairs spiral more and more into crisis situations that are acting as catalysts in a process that is urging us to wake up. One only has to open up the newspapers to read about the climate changes, the war on terror, a new cold war with Russia, another US thread to attack Iran, the peak oil situation and the current world wide financial crisis, to understand

that we live in critical times. These events are bad harbingers of a dark future for humanity if we don't wake up and make a U-turn quickly.

It's becoming increasingly clear that the future of humanity cannot thread along the same paths of the past. We are living in extraordinary times where a global consciousness shift is required if we are to avoid a total collapse of our climate, our biosphere, our financial systems, our economies and world peace. The world is in desperate need of new leaders that will illuminate the way and prevent us from the chaos that is looming over the horizon.

System theorist professor Ervin Laszlo, founder of the club of Budapest, warns us that all the developments in the world will lead to a crescendo around 2012. Laszlo makes this prediction based on chaos theory and claims that the world acting as a complex chaotic system will come at a cross roads around 2012. We now live a critical time where real changes and breakthroughs need to be made if we are to avoid a catastrophe.

Then there's the Mayan calendar that will expire coincidentally on December 21st 2012. The ancient Maya predicted the current climate changes and warned us that we now live in a time of cleansing before a new Sun, meaning a new World Age, would commence at the end of the Mayan calendar.

Independently two different evolutionary theories have been developed. Both theories predict that the year 2012 will be a special time in the evolution of mankind. The first theory is based on the Chinese oracle book the 'I Ching'. It was developed by Terrence McKenna who found a fractal pattern in the I Ching. This fractal pattern led to the development of the fractal 'Time Wave function'. This function plots changes or novelties in time and it is said to monitor humanity's evolution. Without having any prior knowledge of the Mayan calendar, oddly enough, McKenna's Time Wave function implodes into a singularity, predicting a moment of great changes around the end date of the Mayan calendar!

My friend professor Dr. Sergey Smelyakov has independently developed a similar theory based on the Mayan calendar itself. I have been able to help him with this theory to make it fractal and truly implode towards the end of the Mayan calendar, December 21st 2012. This model also predicts an increase in the frequency of changes towards infinity at the end of the Mayan calendar.

It's not hard to see that the current developments in our world are indeed occurring faster and faster which may very well lead to more radical changes in our world as we approach 2012. I strongly feel and believe that we live in this time of great changes that were predicted by the Maya, it's a time of a world transformation.

The current financial and economic crisis in the world will act as a catalyst for dramatic future changes. The Maya tell us that this is the time of purification and all 'darkness' and 'corruption' in our world will be brought to the light first before it will be cleansed and transformed into something new. The current corrupt financial system needs to be transformed fundamentally to make it sound again. This is but one example of the probably many crucial changes that lie ahead of us.

It's therefore very important that dramatic new insights emerge to help solve the current global problems. The main cause of the current global state of affairs, I believe is due to the selfishness and greed of man. This has lead for one thing to

the current financial crisis. The root cause of our problems I believe however are mankind's distorted view of reality.

The world which is becoming smaller and smaller every day, has grown into one global village community. The internet for instance acts as a mediator between people from around the world that would otherwise never have met. Globalization, the major drive of companies to expand their business on a global scale, has led to a global interconnectedness and mutual dependency of economies.

Yet we still keep this old-fashioned idea believing that what happens at the other end of the world, won't affect us locally. We also tend to believe that where we live, global warming won't affect us. We tend to believe that a war in Iraq won't really affect us. We tend to believe that the collapse of the banking system in the US won't really affect us, at least not immediately. The truth however is, that the world as a whole with its infinite interdependencies, acts like a chaotic system and responds to even the smallest changes within this system.

Within chaos theory this is called the 'butterfly effect' and this is why the financial problems that started in the US now spread like a virus over the entire planet.

We as a species are now forced more than ever before in history to collectively deal with our mutual problems because the global community has become an interwoven web of mutual dependencies.

The Darwinian 'survival of the fittest' mentality that we used in the past won't work any longer in a world where everything has become interrelated and interdependent. What we do over here will eventually affect others over there and will come back at us rather sooner than later. We have to face up to the reality that we can only solve our problems collectively.

As Einstein once said 'you can't solve a problem with the same mindset that created the problem'. So a new way of thinking is required.

As the title of my book suggests human beings tend to have a distorted view of reality since we set ourselves apart from Mother Nature. Our distorted view tells us that we are separate beings with individual egos and it's this concept of self that leads to selfishness and a Darwinian 'survival of the fittest' mentality.

This distorted view of reality includes our distinction between the spiritual and the physical domains. The current scientific paradigm of modern science is telling that all observable phenomena in nature have a physical cause within the physical realm. Consciousness awareness is explained as an epiphenomenon, a side effect of the electrical activity of the brain, the firing of synapses and the brain waves that are created. The brain activity allows us for a consciousness awareness of an outside world that we as the observer experience as separate from ourselves.

Eastern spiritual traditions on the other hand teach that the human ego is based on an illusion. We are all but different aspects of the same oneness consciousness that pervades the universe. In reality there's really only ONE of us here, so they claim.

Scientific research in the domain of quantum physics is now revealing that everything in the physical universe is indeed interconnected. Scientists call this connectedness 'quantum entanglement'. It means that at the quantum level of subatomic particles all these particles are connected. Separatism simply seizes to exist at the quantum level.

Quantum science also explains that there's an invisible energy field at the very foundation of all physical reality. This field is called the zero point field. The physical world is floating in this sea of energy that is so huge that's its beyond our capacity to grasp it. The zero point field must exist due to Heisenberg's uncertainty principle which states that at the quantum level measuring a particles location makes its momentum uncertain, while measuring its momentum makes its position uncertain. This means that at no certain time can we know both the location and momentum (speed) of a quantum particle.

If we were to miniaturise a clock with a large pendulum to the scale of an atom, the pendulum of the miniature clock would be swinging eternally. If it would stop, both place and momentum of the pendulum would be known and this would violate the Heisenberg principle. This means that at the quantum level there's a sea of energy constantly energizing particles and these particles can never come to rest, not even at the lowest possible temperature of 0 degrees Kelvin. This is why this energy is called zero point energy. It's the energy that remains even at 0 degrees Kelvin when according to classical physics all atoms should have seized moving. At the sub atomic level however, the clock of the universe keeps ticking eternally.

Now a hundred years after the foundation of quantum theory by Max Planck, scientists are finally coming to grips with the implications of quantum physics. While in the quantum realm we can no longer speak of a strict separation of all physical matter, scientists have also discovered that the strict separation between the physical and mental world cannot be made. Experiments in the realm of quantum phenomena have shown time and again that the observer and the observed phenomena cannot be separated from each other. The scientist as the observer of an experiment is part of his own experiment and his consciousness observation influences the experiment by the way the quantum wave collapses. This makes him a participator and a co-creator of the reality that he is observing.

In his book 'Quantum entanglement', Dean Radin professor at the University of Princeton and a member of the Edgar Mitchel's institute of Noetic sciences describes how research into 'mind over matter' phenomena has proven beyond a shadow of a doubt that the phenomena are real. There's abundant proof that the mind can alter and has control over the physical domain.

It's has taken science 300 years after Descartes and Newton, the founders of modern science, to come to this conclusion. The point is that we are using our 'mind over matter' powers almost continuously and on a daily basis throughout our lives. A simple thought experiment proves that 'mind over matter' is real. Whenever an immaterial thought pops up in our head to 'stir the coffee before drinking, this immaterial thought releases neurotransmitters and causes synapses in the brain cells to fire. The immaterial thought stemming from the spiritual domain is materialised into signals in the physical domain that are sent to the muscles in the fingers while the coffee is being stirred.

The 'mind over matter' governance of our own consciousness is part of our daily life experience when immaterial thoughts are being translated into physical bodily actions. There's an interface between the mental and the physical plane where thoughts can cross the border to become materialised into the physical realm.

Some quantum scientists are asking the question whether this border really exists at all. Professor Amit Goswami, a quantum scientist has taken the stance that there's no such separation and he's developed a new ground-braking physics called 'physics within consciousness'. He has turned the current paradigm upside

down by stating that the spiritual domain is the first cause of creation and that the physical world is an effect and not the cause of the spiritual domain. He's not the only scientist to come to this conclusion since more and more scientists are now threading the same path that Goswami has paved.

Merging science and spirituality, bridging the gap between the physical and mental planes and developing new models in physics that no longer exclude consciousness, has been and should be the real 'quest for the holy grail in science'. It's my humble opinion that no physics theory can be complete if one omits consciousness in these models.

My book delves into the merger of science and spirituality. It's a journey that leads the reader not only along the discoveries of quantum physics but also along the discoveries of torsion physics. Torsion physics has been developed by Russian scholars. Torsion waves are waves that travel in a spiralling manner at superluminal speeds, meaning faster than light! Yes that's right, Einstein was wrong; energy can travel faster than light. Einstein's relativity theories did not account for spin and angular momentum. He later tried to correct this omission in his relativity theory with an additional theory that has become known as the Einstein-Cartan theory.

New torsion wave based physics are now being developed based on an ancient knowledge called 'Sacred Geometry'. It has been passed down through the centuries in occult traditions. We mention but the names of David Wilcock, Daniel Winter and Nassim Hamein who basically merge the Russian torsion physics with Sacred Geometry. Nassim Hamein's theory has already proven to be a true unified field theory that Einstein was looking for. It takes into account the missing spin, torsion or angular momentum that lacks from Einstein's relativity theories. Hamein's work is very promising and is supported by a professor within mainstream science. Hamein's theory also has proven to unite Einstein's relativity theories with quantum physics. This unification attempt is also the goal of mainstream physics 'string theory'!

The Russian physicist Nikolai Kozyrev in addition has proven that torsion fields must be associated with consciousness since the brain is also capable of creating these torsion fields.

The new emerging torsion physics explains how the spiralling waves organize themselves in repeating patterns creating our observable physical world. These repeating energy patterns form a universal principle that is applied to built subatomic particles as well as planets, stars, solar systems and galaxies. This universal principle is called a fractal and it's a recurring pattern found everywhere in the universe from the very small to the very large. Strangely enough around the world crop circles have appeared that demonstrate exactly how these fractal energy patterns are organized. If these crop circles were manmade, then surprisingly enough the makers of these circles must be well educated in this new physics that is now being developed.

The current scientific discovery of the fractal interconnectedness of all physical matter in the universe is but the equivalent of the ancient Akasha field. It shows that at the fundamental level there only exists Oneness in the universe. Eastern spiritual traditions teach that consciousness is primordial and is the quintessence of all physical reality. A small but ground braking group of scientists are now sharing this ancient spiritual wisdom within science, merging both science and spirituality.

It is this wisdom that humanity needs at the crossroads in this critical timeframe of our history before the problems we are facing start to spiral out of control. The world is One and we cannot solve our problems with an outdated Darwinian mindset, still believing in the survival of the fittest. In this time frame there won't be any winners any longer. We will all become losers if we continue to travel along this destructive road to never-never land. Total annihilation and extinction awaits the so-called quote unquote winners at the end of the voyage.

It's therefore encouraging to realize that 'Postkvantnost d.o.o' will be an organisation that will spread this new knowledge and mindset in Croatia. We need new management and leaders with a totally new and holistic view on doing business. Business can be run in a non-competitive mode and with respect for each other and the environment, if we start to realize that we are not separate from the universe. We are no passive lookers-on but active co-creators of our own reality. We can change the world for the good of all if we know we are part of the Oneness. This Oneness goes by many names, some prefer to call it Allah or Buda, others call it God or the Creator, some call it Mother Nature or just the universe or the cosmos. The fact is that we are and never have been separated from the Source.

I wish 'Postkvantnost d.o.o', all the best in their mission to spread this Post Quantum paradigm. Let me finally express my deepest gratitude to Mr Sinisa for inviting me to come to Zagreb and for all the support that I received from you with respect to the translation of my book. Let me also express my deepest respect and gratitude to Mr Mladen Kvaternik for his translation of my book. You two have proven that you are already living the message of my book by your non-selfish goal to share my book with the people in Croatia.

Thank you all for being here today.

Jan Wicherink
